

THE CHAOS

Stop manual SaaS onboarding *nightmares*

A US Series A team was spending 45 minutes manually setting up every new customer after contract sign-off.

01

Drowning in tabs and copy-paste

Ops had to manually create Slack channels, provision Postgres databases, and update HubSpot. One typo ruined the client experience.

02

Connecting the APIs *instantly*

I built a Node.js worker that listens to DocuSign webhooks, extracts variables via AI, and triggers the workspace setups.

03

Onboarding done in 8 seconds

The moment the contract is signed, the tenant provisions, the Slack channel is built, and CRM records sync automatically.

04

Zero errors and hours *saved*

The team saved 15 hours a week and eliminated day-one setup delays before their 9 AM ET standup even starts.

Want this on *your* stack?

DM your stack (CRM + chat + project tool) and I will suggest 3 custom automations to scale your ops.

Comment *AUTO* to start.
