

HOOK

Stop building *fragile* SaaS automations

Zapier webhooks fail at scale. Here are three critical mistakes killing your workflows and how to fix them.

01

No error retries or backoffs

Mistake: If an API is down for 10 seconds, the automation fails permanently. Fix: Build Node.js workers with exponential backoff on failure.

02

Hardcoding API rate limits

Mistake: Blasting HubSpot or Salesforce APIs all at once. Fix: Use a Redis-backed queue like BullMQ to throttle requests safely.

03

Zero SOC 2 compliance trail

Mistake: Passing sensitive customer data through third-party tools without logs. Fix: Store encrypted execution logs in PostgreSQL.

04

The shift to *production-grade* code

Stop relying on basic visual builders for core SaaS ops. Custom code handles errors, scales effortlessly, and saves thousands of dollars.

Want this on *your* stack?

Comment AUTO and I will suggest 3 custom automations.

Comment *AUTO* to start.
