

HOOK

How I ship *fixed-price* SaaS automations

No bloated scoping phases or missed deadlines. Here is my blueprint for building robust, custom AI systems in production.

01

Mapping the *critical* API path

We trace your data from Calendly or DocuSign to Postgres. We map every webhook, schema detail, and API rate limit before writing code.

02

Building the *resilient* core engine

I write Node.js or Python workers with built-in retry logic. If an external API like Stripe goes down, our queues keep your data safe.

03

Layering the *AI* processing agents

We feed structured API data into Gemini or Anthropic. The AI handles data synthesis and delivers clean briefs to your team in Slack.

04

Rigorous *testing* and deployment

We test against edge cases and deploy directly to your cloud. You get full audit logs and error-tracking dashboards ready for SOC 2.

Want this on *your* stack?

Comment AUTO or DM AUTO and I will suggest 3 automations.

Comment *AUTO* to start.
