

CHECKLIST

The SaaS *pre-build* checklist

What US SaaS ops leaders must audit before hiring an automation developer.

01

Map your *webhook* triggers

Identify if tools like HubSpot, Stripe, or Calendly can send payloads instantly, or if you need to build custom polling cron jobs.

02

Audit API *rate limits*

Verify that your existing software subscription tiers support your daily transaction volume to avoid API lockouts.

03

Review *compliance* boundaries

Ensure your custom endpoints and intermediate storage comply with your SOC 2 audit trail when handling PII.

04

Define *human-in-the-loop* gates

Decide which steps can run fully autonomously and which steps require a Slack approval button before updating your CRM.

Want this on *your* stack?

DM me your stack (CRM + chat + project tool) and I will suggest 3 automations.

Comment *AUTO* to start.
